Welcome to Haven

Read me first: installing takes about a minute.

1 Drag Haven into Applications

In the window that opened, drag the Haven icon onto the Applications folder.

2 Open Haven

Open your Applications folder (Finder › Go › Applications, or ⇧⌘A) and double-click Haven.

3 First time only: tell macOS you trust Haven

Haven was built just for you, so it isn't notarized by Apple. The first time you open it, macOS may say “Apple could not verify Haven is free of malware”. That's expected. Click Done, then:

• macOS 15 Sequoia or later: open System Settings › Privacy & Security, scroll down to Security and click “Open Anyway” next to Haven. Confirm with your password, then click Open Anyway again.

• macOS 14 Sonoma: right-click (or Control-click) Haven in Applications, choose Open, then click Open.

Prefer Terminal? This does the same in one line:

```
xattr -dr com.apple.quarantine /Applications/Haven.app
```

You only do this once. After that Haven opens like any other app.

4 Take the one-minute tour

Haven opens with a short welcome tour. When it asks about folders, click Allow for Desktop, Documents and Downloads, and click OK when macOS asks. Haven only reads them to show and search your files.

You'll pick a look (Playful or Minimal), try a plain-English search, and test Quick Search (⇧⌘Space).

Private by design: no account, no uploads, no internet use at all. Reading text in images and finding duplicates happen on your Mac. Haven never deletes files; they only go to the Trash, and you can undo.

Everyday Haven

The things you'll use most, and their shortcuts.

- **Search like you talk (⌘F)**
  Type “pdfs from last week”, “screenshots over 5 MB”, “photos from whatsapp” or “big videos older than a year”. Haven shows how it read your words as chips; click × on a chip to drop it. Matches names, tags, folders and the text inside screenshots, photos and PDFs.
- **Quick Search from any app (⇧⌘Space)**
  A Spotlight-style panel. ↩ opens the file, ⌘↩ shows it in Haven, ⌥↩ shows it in Finder, ⌘C copies it. Change the shortcut in Settings › Quick Search.
- **Copy text from images (⇧⌘C)**
  Hover a screenshot or PDF and click the Copy Text button, or open the big preview (double-click) and select text right in the picture.
- **Downloaded From (⇧⌘J)**
  Downloads grouped by Gmail, Google Drive, ChatGPT, Canva, WhatsApp, Slack, GitHub, AirDrop or any website. Every list also has a “From” filter.
- **Duplicates (⇧⌘D) and Clean Up (⇧⌘K)**
  Finds identical files and look-alike photos, old installers, forgotten downloads, old screenshots, big old videos, unused apps and zips you already unzipped. You review everything first; files go to the Trash and Undo puts them back. See Activity for a full history.
- **Menu bar**
  The ten newest downloads with thumbnails. Drag them straight into Mail, Slack or Figma.
- **Saved searches & rules**
  Save any search to the sidebar; it updates by itself. Optional rules (off by default) can trash old installers or file screenshots into monthly folders.
- **Shortcuts & Siri**
  Use “Find Files”, “Get Latest Download” and “Search in Haven” in the Shortcuts app.

More shortcuts

Space	Quick Look	**⌘I**	Inspector
⌘1 / ⌘2	Grid / List	**⌘+ / ⌘−**	Card size
⌃⌘T	Switch look	**⌘⌫**	Move to Trash
⌘Z	Undo	**⌘/**	All shortcuts

To remove Haven: quit it, drag it from Applications to the Trash, and delete the folder ~/Library/Application Support/Haven. Replay the tour any time from Help › Welcome Tour.

Getting more done

Tools for the chores Finder makes slow.

- **Smart rename (⌘R)**
  Rename one file or hundreds: add dates, numbers, find & replace, or name screenshots and PDFs by what's written in them (“2026-10-12 Boarding Pass.png”). You see every new name first; ⌘Z undoes it.
- **Space**
  See which folders and files take the most room, by kind, by where they came from and by when you last used them. Click a folder to look inside; folder sizes also show in list view.
- **Your own rules**
  On Clean Up: “PDFs from Gmail with ‘invoice’ in them → Documents/Invoices”, “WhatsApp photos → Pictures/WhatsApp”, or name screenshots by their text. Start from an idea, see what a rule would do before turning it on, and undo anything it did from Activity.
- **Make Shareable**
  Right-click: Save as JPEG (for HEIC photos), Make a Smaller Image, Make a Smaller PDF, or Compress as ZIP. Copies go next to the originals, which never change.
- **The Shelf (⌥⌘S)**
  A small window that floats over every app. Drop files on it from anywhere, then drag them all into Mail, Slack or a folder at once.
- **Collections**
  Like playlists for files: one file can be in many collections and stays where it is. Drop files onto a collection in the sidebar, or right-click › Add to Collection.
- **Text in more files**
  Haven also reads Word, Excel, PowerPoint, OpenDocument and EPUB files, the first page of Pages, Numbers and Keynote files, and web pages, with its own index (it doesn't rely on Spotlight).
- **Copy List and Open/Save jump**
  Copy List above any list copies names, paths or a table for Numbers or Excel. In an app's Open or Save dialog, open Quick Search, pick a folder and press ⌃↩ to jump there.

File Tools

Convert, compress, edit and transcribe, all on your Mac.

- **How to use them**
  Right-click a file (or several) and choose Tools: you only see the ones that fit. Or open File Tools (⇧⌘T) and click a tool, or drop files on it. New files go next to the originals, which never change, and Undo moves them to the Trash.
- **Images**
  Convert between JPEG, PNG, HEIC, TIFF and WebP; resize; rotate; remove location, camera and dates before you share; cut out the subject with Remove Background.
- **PDF**
  Merge, split into pages, reorder, rotate or take out pages, pick pages for a new PDF, turn photos into a PDF and pages into pictures, add or remove a password, and sign with a signature you draw once.
- **Video and audio**
  Compress, convert to MP4 or MOV, trim, make a GIF, take out the sound or keep only the sound, merge clips and change speed. Audio converts to M4A, WAV, AIFF or FLAC. No extra software needed.
- **Transcribe**
  Whisper (OpenAI's open-source speech model) turns what's said in videos and voice memos into text or subtitles, on your Mac. The first time, Haven downloads the model (190 or 574 MB). What's said becomes searchable too: search “quarterly budget” and find the meeting recording.
- **Translate and summarize**
  Translate documents and subtitles with the languages built into macOS (macOS 15 or later). Summaries come from Apple Intelligence on Macs that have it (macOS 26).
